

Psychopathology Class Resource List
William F. Doverspike, Ph.D.
Bibliography
Updated February 18, 2019

These reference entries include sources that may be cited in class. The purpose of this bibliography is to assist students in finding a source of information if the citation is not contained in the lecture notes or presentation decks. These sources vary widely in terms of their degree of scholarly value, ranging from publications in peer-reviewed scientific and professional journals to internet blog posts describing the personal experiences of individual authors. As a general rule when writing papers, students should cite only scholarly sources and peer-reviewed research.

- Kendler, K. S., Myers, J., & Zisook, S. (2008). Does bereavement-related major depression differ from major depression associated with other stressful life events? *American Journal of Psychiatry*, 165(11), 1449-1455.
[Based on their study of a range of validators in a large-population-based sample of twins, the authors evaluated whether cases of bereavement-related depression that also met DSM criteria for “normal grief” were qualitatively distinct from other depressive cases. The similarities between bereavement-related depression and depression related to other stressful life events substantially outweigh their differences. The authors question the validity of the bereavement exclusion for the diagnosis of major depression.]

[The authors outline an Antidepressant Food Scale that lists 12 antidepressant nutrients linked to the prevention and treatment of depression: Folate, iron, long-chain omega-3 fatty acids (EPA and DHA), magnesium, potassium, selenium, thiamine, vitamin A, vitamin B6, vitamin B12, vitamin C, and zinc. On the Antidepressant Food Score (AFS), the highest scoring foods were bivalves such as oysters and mussels, various seafoods, and organ meats for animal foods. The highest scoring plant foods were leafy greens, lettuces, peppers, and cruciferous vegetables]

Remission from post-traumatic stress disorder in adults: A systematic review and meta-analysis of long term outcome studies. *Clinical Psychology Review*, 34(3), 249-255. doi: 10.1016/j.cpr.2014.03.002 [Morina and colleagues conducted the first systematic review and meta-analysis on spontaneous long-term remission rates (i.e., without specific treatment) of post-traumatic stress disorder in adults. Across all studies, remission rates varied between 8% and 89%, with an average of 44.0%. Publications on PTSD related to natural disaster reported the highest mean of remission rate (60.0%), whereas those on PTSD related to physical disease reported the lowest mean of remission rate (31.4%). The authors conclude that long-term remission from PTSD without specific treatment varies widely and is higher in studies with the baseline within five months following trauma.]

[This book's second edition was published in 1998 and third edition was published in 2004. Dr. Sapolsky proposes that for animals such as zebras, stress is generally episodic (e.g., running away from a lion), whereas for humans, stress is often chronic (e.g., worrying about losing a job). For this reason, proposes Sapolsky, many wild animals are less susceptible than humans to stress-related disorders such as ulcers, hypertension, decreased neurogenesis, and increased hippocampal neuronal atrophy. Based on Sapolsky's research with baboons, chronic stress for some social primates who are in the lower level of the social dominance hierarchy.]
